

LHC_RES data set

This life history data set is a re-structured version of the LHC_UYR data set. The data has been re-structured so that each observation is a residence. Given this type of re-structuring, the number of observations has increased, while the number of variables has decreased. Furthermore, since this data set was constructed for the "circular migration" work, the only life history variables on the residence observation are related to residence, jobs and education at that residence.

Number of Person Residences

335,441

Number of Variables

38
