Wave I - II: Family Structure Array Variables

Nineteen constructed family structure array variables are available for Add Health respondents (Wave I or II) from birth to age at latest adolescent follow-up, with a maximum age of 18 years old ($n = 20,745$).

The family structure array variables can be used to construct measures such as the number of family structure changes experienced from birth to a given age (family instability), or the amount of time spent in different family structures.

Include a brief statement below explaining the necessity and relevance of these data to your research agenda.

Please return the completed data order form by email to:
