This study focuses on adapting Project Connect, a relationship-based HIV prevention intervention that was found to be effective in increasing condom use amongst couples in the US, to South African men at high risk of HIV infection (ages 25-34 yrs) and their younger female partners (ages 16-24 years). Upon completion of these activities, we will conduct a small pilot study of the adapted intervention with couples from inner-city Johannesburg to determine the acceptability and feasibility of the revised intervention.

This evaluation involved a nationally representative household survey of HIV prevalence and related risk behaviors among young people in South Africa- this study was completed in 2003 and ongoing analysis of the data continues. It also involved a quasi-experimental, repeated cross-sectional community based survey comparing two youth friendly interventions to a control arm in 33 communities throughout South Africa; this study was completed in 2004.
